

Whether as a proactive measure or an extra level of protection after a leak, SmartBall can be used in any situation to confirm product containment.

Challenge

- An operator based in the U.S. experienced a leak on one of their transmission pipelines.
- The leak was identified by a third party and not by their leak detection system.

Solution

- The operator shut down the pipeline to conduct repairs.
- Their restart plan included a **SmartBall** survey, and PureHM mobilized within a week of the inspection request.

Outcomes

- PureHM **confirmed containment.**
- SmartBall inspection results showed that the operator did not have any other current areas of concern.
