1. Introduction and Safety

1.1 Purpose of this manual

This manual shows and discusses the Modbus® addresses implemented in Smart Pump Range products.

The data managed by the Smart Pump Range unit consist of:

- Parameters: read & write, used to set modes, activate functions and write on the drive
- Information: read only, to acquire values from the drive.

CAUTION:

Before using the unit make, sure to read and fully understand the Smart Pump Range Use and Maintenance Manual.

1.2 Acronyms

MIN	Minimum
MAX	Maximum
DEF	Default
R	Read only
R/W	Read & Write
UM	Unit of measurement
LSW/MSW	Least Significant Word / Most Significant Word
N.A.	Not accessible through the user interface

2 A few facts about the Modbus® Protocol

NOTE:

The Modbus® Protocol is an international standardized Bus Protocol. The general information within this Manual is just a brief overview, for detailed information please use the Modbus® Protocol Reference Guide, or any other source of information (e.g. Modbus® org. "MODBUS® application protocol specification" available on the Internet).

This protocol defines a message structure that controllers will recognize and use, regardless of the type of networks over which they communicate. It describes the process a controller uses to request access to another device, how it will respond to requests from the other devices, and how errors will be detected and reported. It establishes a common format for the layout and contents of message fields.

During communications on a Modbus® network, the protocol determines how each controller will know its device address, recognize a message addressed to it, determine the kind of action to be taken, and extract any data or other information contained in the message.

2.1 Communication

Smart Pump Range products use the RS485 serial interface that defines connect pinouts, cabling, signal levels, transmission baud rates and parity checking.

Controllers communicate using a master-client technique, in which only the master can start a transfer or polling. The other devices (Clients) respond by supplying the requested data to the master, or by taking the action requested in the query.

2.2 Broadcasting

On Smart Pump Range products the broadcast function is not supported.

2.3 Data protection

Standard Modbus® serial networks use two kinds of error checking:

- Parity checking (even or odd) can be optionally applied to each character
- Frame checking (LRC or CRC) is applied to the entire message.

Both the character check and message frame check are generated in the master device and applied to the message contents before transmission. The client device checks each character and the entire message frame during receipt.

Detailed information can be found in the Modbus® Protocol Reference Guide.

2.4 Transmission mode

The data managed by the Smart Pump Range unit can be accessed considering the Modbus® virtual memory, consisting of Holding Registers for all values.

The Modbus® Protocol transmission Mode available on Smart Pump Range products is Modbus® RTU (selectable via parameter P50 Communication protocol).

The serial port communication parameters (P51 Address, P52 Baudrate, P54 Parity Mode) shall be selected according to network configuration.

NOTE:

The mode and serial parameters must be the same for all devices on the Modbus® network.

The following modes are supported by Smart Pump Range products and can be selected via parameter P54 Parity Mode:

- 8N1 1 start bit, 8 data bits, 1 stop bit, No parity
- 8N2 1 start bit, 8 data bits, 2 stop bits, No parity
- 8E1 1 start bit, 8 data bits, 1 stop bit, Even parity
- 8O1 1 start bit, 8 data bits, 1 stop bit, Odd parity¹

The default serial port configuration is P51 Address = 1, P52 Baudrate = 9600, P54 Parity Mode = 8N1.

2.5 Supported function codes

The Modbus® protocol function codes implemented in Smart Pump Range products are:

- Read Holding Registers (hex code 0x03), to read both Holding Registers representing Parameters and Information
- Write Multiple Registers (hex code 0x10), to write Holding Registers representing the Parameters.

2.5.1 Example 1

0x03 Read Holding Registers - READ COMMAND read the binary contents of holding registers in the client.

Note: the Modbus® Registers are addressed starting at zero, e.g. Holding Register indexed 0x3F has to be addressed as 0x3E.

Example: Read the Current Pressure

Query

Client Address	0x01	Could be set on Smart Pump Range products via parameter P51
Function	0x03	Read Holding Register
Starting Address High	0x00	
Starting Address Low	0x3E => 62 DEC =>	Current Pressure Modbus address
No. of Points High	0x00	
No. of Points Low	0x01	Read one holding register is supported
Error Check CRC-High	0xC6	
Error Check CRC-Low	0xE5	Generated CRC-Checksum

Response

Client Address	0x01
Function	0x03
Byte count	0x02
Data High	0x02
Data Low	0x08 => 208 HEX = 520 DEC =>
	Actual Value = 5,20 bar
Error Check CRC-High	0xE2
Error Check CRC-Low	0xB8
	Generated CRC-Checksum

¹ When the optional RS485 Module Smart Pump is installed, the network configuration 801 is not available and the parameter P52 does not show this selection.

2.5.2 Example 2

0x10 Write Multiple Registers - WRITE COMMAND writes values into a block of contiguous registers. Broadcast is not supported.

Note: the Modbus® Registers are addressed starting at zero, e.g. Holding Register indexed 0xCB has to be addressed as 0xCA.

Example: set Ramp 1 and Ramp 2 to 25 s, Ramp 3 and Ramp 4 to 100 s.

Query

Client Address	0x01	Could be set on Smart Pump Range products via parameter P51
Function	0x10	Write Multiple Registers
Starting Address High	0x00	
Starting Address Low	0xCA	=> 202 DEC => first register is Ramp 1
Q.ty of Registers High	0x00	
Q.ty of Registers Low	0x04	a total 4 registers (Ramp 1 to Ramp 4) to be written
Byte count	0x08	2 * Quantity of Registers
Reg Value High	0x00	
Reg Value Low	0x19	=> 19 HEX = 25 DEC => sets Ramp 1 to 25 sec
Reg Value High	0x00	
Reg Value Low	0x19	=> 19 HEX = 25 DEC => sets Ramp 2 to 25 sec
Reg Value High	0x00	
Reg Value Low	0x64	=> 64 HEX = 100 DEC => sets Ramp 3 to 100 sec
Reg Value High	0x00	
Reg Value Low	0x64	=> 64 HEX = 100 DEC => sets Ramp 4 to 100 sec
Error Check CRC-High	0x14	
Error Check CRC-Low	0x78	Generated CRC-Checksum

Response

Client Address	0x01	
Function	0x10	
Starting Address High	0x00	
Starting Address Low	0xCA	
Q.ty of Registers High	0x00	
Q.ty of Registers Low	0x04	a total of 4 registers (Ramp 1 to Ramp 4) written
Error Check CRC-High	0xF4	
Error Check CRC-Low	0xE1	Generated CRC-Checksum

3 Connections and data handling

NOTE:

For detailed information regarding installation, wiring and configuration of the Smart Pump range product, please read and follow the relative manual.

NOTE:

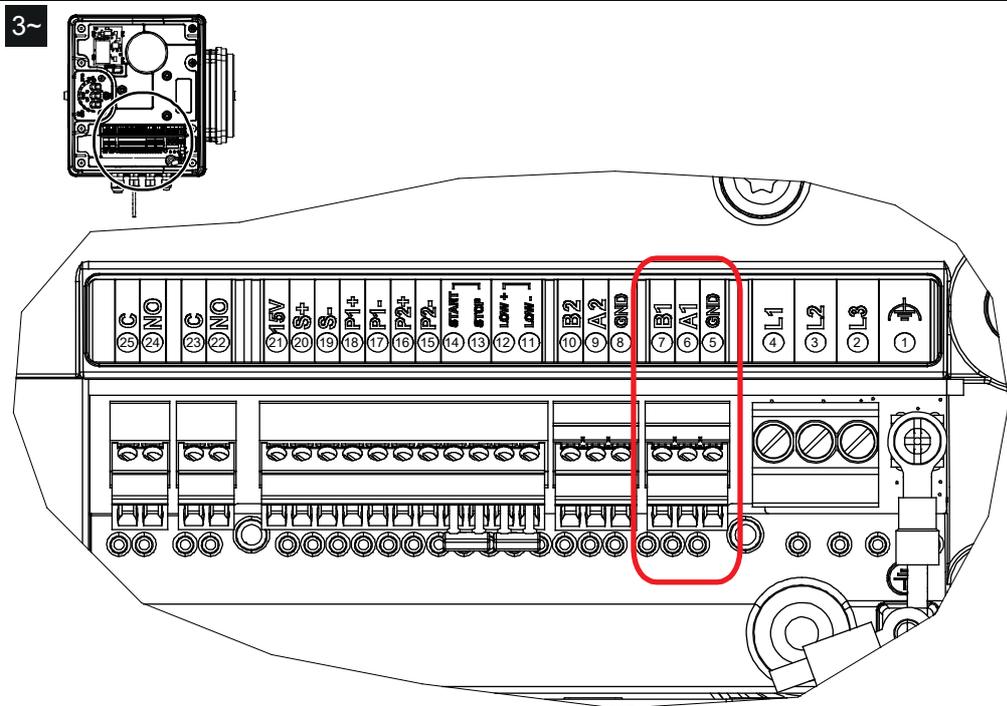

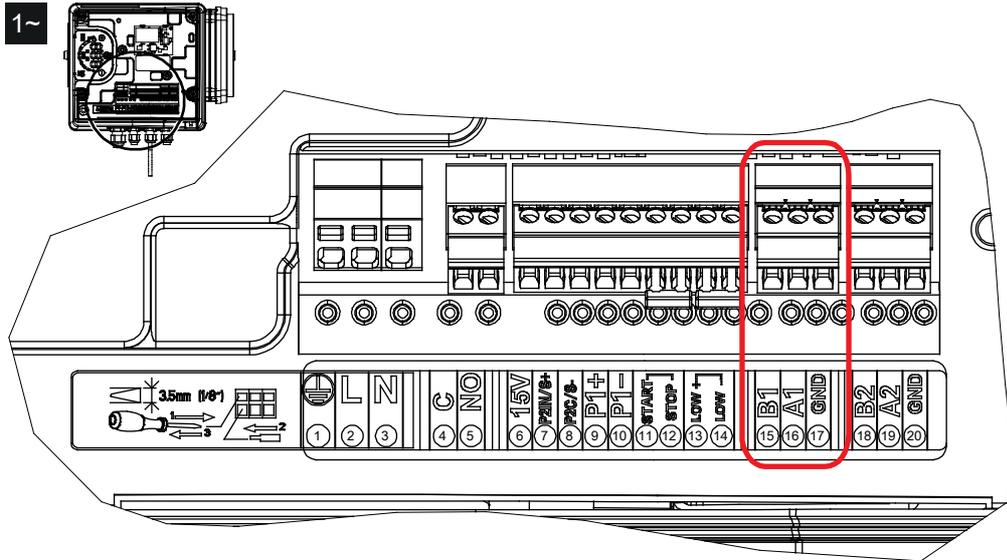

It is suggested to set parameter "P69 Avoid frequent parameters saving" to YES when a Smart Pump range product is connected to an External Device via Modbus®. This parameter limits the frequency with which the unit stores the required value P02 in the EEPROM memory, in order to extend its life.

When the Modbus® RTU communication is active between the Smart Pump range product and an External Device, the Smart Pump range product "locks" the possibility to change most of the system parameters from the local push buttons on the drive. This is to prevent conflicts between the values (read and written) by the (remote) External Device, and the parameters values that could be over-written/changed by the local operator. The remote lock for parameters edit can be disabled stopping the Modbus® communication.

3.1 Connect a stand-alone product to an External Device

- Unscrew the dedicated screws and remove the plastic cover of the Smart Pump electronic drive, in order to proceed wiring the control terminals; for reference, the wiring harness scheme is reported on the terminal block label.
- Terminal position and numbering is different between single phase and three-phase version.
- No additional modules are needed to connect a stand-alone Smart Pump range product to an External Device via RS485.
- Terminals 15 (B1), 16 (A1) and 17 (GND) on single-phase version and 7 (B1), 6 (A1), 5 (GND) on three-phase version are used for the communication with an external control device (e.g. PLC, BMS, etc.).
- Do not connect the ground of the control card to other voltage potentials or to PE.

See chapter 4 for the Registers List of e-LNEEE, e-LNESE, e-LNTEE and e-LNTSE pumps.
See chapter 5 for the Registers List of e-HME, e-SVE, VME and e-SVIE pumps.

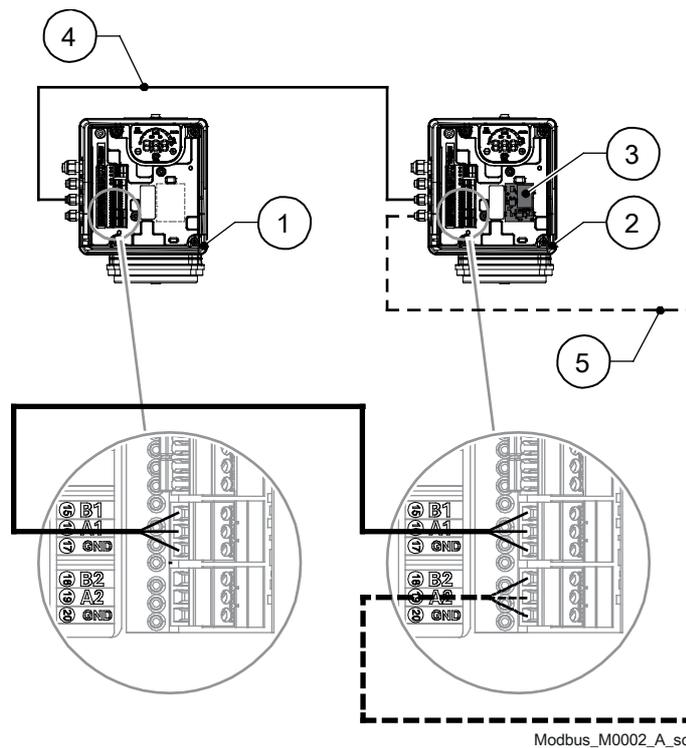

Modbus_M0001_E_sc

3.2 Connect two e-LNEEE, e-LNESE, e-LNTEE or e-LNTSE pumps running in Dual Pump mode to an External Device

The Dual Pump mode, available only for e-LNEEE, e-LNESE, e-LNTEE and e-LNTSE pumps, allows the connection of two motor drives in a MASTER - FOLLOWER configuration.

- Master or Follower configuration can be set via parameter P38 Dual Pump Configuration.
- The information about the Follower unit are available through the Modbus® registers of the Master Unit (see **Registers List of e-LNEEE, e-LNESE, e-LNTEE and e-LNTSE pumps**, page 11).
- The parameter P51 Address need be set only on the MASTER pump.
- To connect a Dual Pump mode set to an External Device, an RS485 Module Smart Pump must be installed on the MASTER unit.
- Terminals 15 (B1), 16 (A1) and 17 (GND) (on single-phase version) and 7 (B1), 6 (A1), 5 (GND) (on three-phase version) are dedicated to the Master - Follower communication (dual pump link).

- Terminals 18 (B2), 19 (A2) and 20 (GND) on single-phase MASTER unit, or terminals 10 (B2), 9 (A2) and 8 (GND) on three-phase MASTER unit, are dedicated to the External Device communication network.

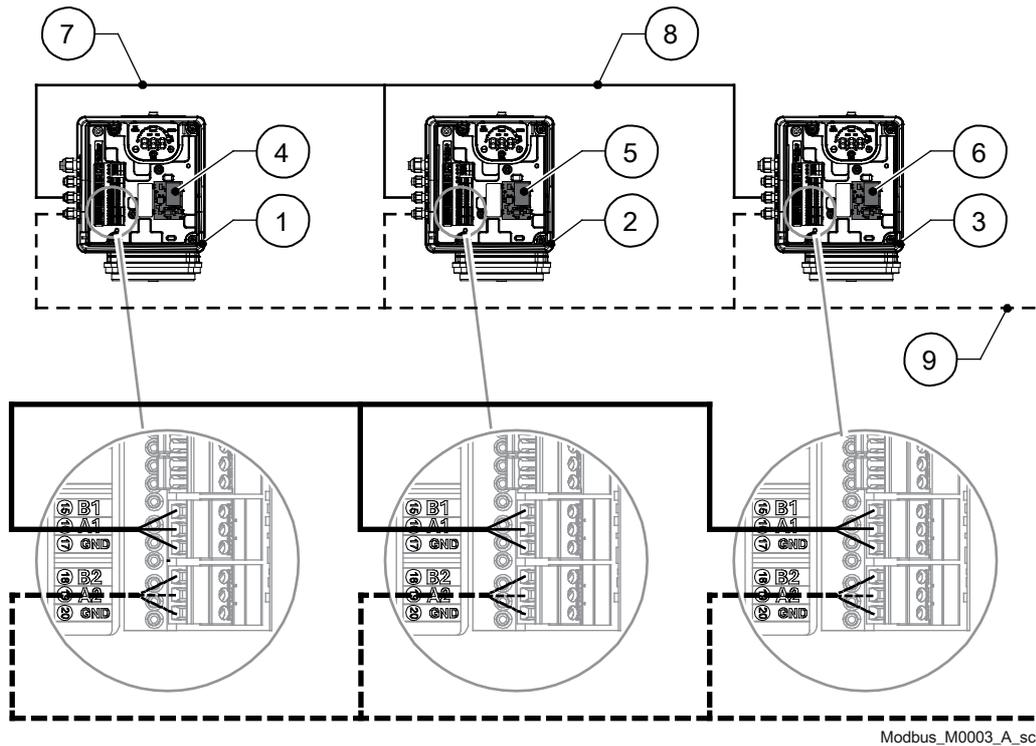

1. Follower drive
2. Master drive
3. RS485 module
4. Dual pump link
5. External device communication network

3.3 Connect two or three e-HME, e-SVE, VME or e-SVIE pumps running in Multi-Pump mode to an External Device

The Multi-Pump mode, available only for e-HME, e-SVE, VME and e-SVIE pumps, allows the connection of two or three motor drives in a Multi-Master Multi-Pump configuration.

- Each unit of the booster set equipped with a RS485 Module Smart Pump has its unique Modbus address and provides a complete list of registers to the External Device (see **Registers List of e-HME, e-SVE, VME and e-SVIE pumps**, page 17).
- The parameter P51 Address must be set to a unique value on each unit of the booster set. The parameter P51 Address is the identification number of the Smart Pump range product in the Modbus network.
- The parameter P55 Multipump Address must be set to a unique value on each unit of the booster set. The parameter P55 is the identification number of the Smart Pump range product in the Multi-Pump network.
- To connect a Multi-Pump mode booster set to an External Device, each drive must be equipped with a RS485 Module Smart Pump. For a two pumps booster set, two RS485 Modules are needed; for a three pumps booster set, three RS485 modules are needed.
- Terminals 15 (B1), 16 (A1) and 17 (GND) (on single-phase unit) and 7 (B1), 6 (A1), 5 (GND) (on three-phase unit) are dedicated to the Multi-Pump communication (multi-pump link).
- Terminals 18 (B2), 19 (A2) and 20 (GND) on single-phase unit, or terminals 10 (B2), 9 (A2) and 8 (GND) on three-phase unit, are dedicated to the External Device communication network.

1. First drive
2. Second drive
3. Third drive
4. RS485 module
5. RS485 module
6. RS485 module
7. Multi pump link
8. Multi pump link
9. External device communication network

Special care should be taken when an External Device (by mean of Modbus® protocol), requires to read and write Smart Pump range product parameters, being the drive connected into a Multi-Pump system too.

In particular:

- In a Multi-Pump application, to “Read Holding Registers” requests on the Modbus®, each Smart Pump range product returns to the External Device exclusively its own parameters, not parameters of other drives connected in the booster set
- In a Multi-Pump application, requests of “Write Multiple Registers” on the Modbus® must be sent by the external device to all Smart Pump range products connected, even if the parameters to be written are “Global” (for the booster set).

1040 [R]	N.A.	Error log [0] Not used	-	-	-	-
1041 [R]	N.A.	Error log [0] Not used	-	-	-	-

The Data log block #1 to #7 have the same list of register of Data log block #0. The addresses are as follow:

- Data log block #1 - from 1050 to 1071;
- Data log block #2 - from 1080 to 1101;
- Data log block #3 - from 1110 to 1131;
- Data log block #4 - from 1140 to 1161;
- Data log block #5 - from 1170 to 1191;
- Data log block #6 - from 1200 to 1221;
- Data log block #7 - from 1230 to 1251.

Each new error condition, corresponding to an error code shown on the display, fills a new Data log block, starting from block #0.

If Data log block #7 is filled, the next error condition fills Data log block #0, deleting previous data stored.

Latest Data log block filled correspond to the information visible via parameter "P09 1st error", the previous Data block information via parameter "P10 2nd error" and so on.

5 Registers List of e-HME, e-SVE, VME and e-SVIE pumps

1028 [R]	N.A.	Error log [0] Rev. measured	rpm	-	-	-
1029 [R]	N.A.	Error log [0] Phase current	mA	-	-	-
1030 [R]	N.A.	Error log [0] Alarm BitField LSW	-	-	-	-
1031 [R]	N.A.	Error log [0] Alarm BitField MSW	-	-	-	-
1032 [R]	N.A.	Error log [0] Status BitField I/O	-	-	-	-
1033 [R]	N.A.	Error log [0] Power	W	-	-	-
1034 [R]	N.A.	Error log [0] Reserved	-	-	-	-
1035 [R]	N.A.	Error log [0] Pressure	bar/100, psi/10	-	-	-
1036 [R]	N.A.	Error log [0] Power module temperature	°C	-	-	-
1037 [R]	N.A.	Error log [0] Start/Stop status (see register 50)	-	-	-	-
1038 [R]	N.A.	Error log [0] Reserved	-	-	-	-
1039 [R]	N.A.	Error log [0] Error BitField MSW	-	-	-	-
1040 [R]	N.A.	Error log [0] Not used	-	-	-	-
1041 [R]	N.A.	Error log [0] Not used	-	-	-	-

The Data log block #1 to #7 have the same list of register of Data log block #0. The addresses are as follow:

- Data log block #1 - from 1050 to 1071;
- Data log block #2 - from 1080 to 1101;
- Data log block #3 - from 1110 to 1131;
- Data log block #4 - from 1140 to 1161;
- Data log block #5 - from 1170 to 1191;
- Data log block #6 - from 1200 to 1221;
- Data log block #7 - from 1230 to 1251.

Each new error condition, corresponding to an error code shown on the display, fills a new Data log block, starting from block #0.

If Data log block #7 is filled, the next error condition fills Data log block #0, deleting previous data stored.

Latest Data log block filled correspond to the information visible via parameter "P09 1st error", the previous Data block information via parameter "P10 2nd error" and so on.

Xylem |'zīləm|

- 1) The tissue in plants that brings water upward from the roots;
- 2) A leading global water technology company.

We're a global team unified in a common purpose: creating innovative solutions to meet our world's water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.
